

FEATURES

- Industrial Standard DIP-24 Package
- ► Ultra-wide 4:1 Input Voltage Range
- ► Fully Regulated Output Voltage
- ▶ Ultra-high Isolation 8000VDC with Reinforced Insulation, rate for 1000Vrms Working Voltage
- ► Qualified for IGBT and Hi Isolation Applications
- ▶ Operating Ambient Temp. Range -40°C to +85°C
- Overload and Short Circuit Protection
- ▶ Designed-in Conducted EMI meets EN 55032 Class A
- ► UL/cUL/IEC/EN 60950-1 Safety Approval & CE Marking

PRODUCT OVERVIEW

The MINMAX MIEI03-HI series is a new range of isolated 3W DC-DC converter modules in DIP-24 package which feature a ultra-wide input range, fully regulated output and Ultra-high Isolation voltage rated for 8000VDC with reinforced insulation. Further features include overload protection, short circuit protection and EN 55032 class A compliant as well. There are 8 Models available for 24 and 48VDC input. These converters offer a cost-effective solution for wind turbine, solar panel, transporation systems, industrial control equipments and some IGBT driver applications where a very high I/O-isolation is required.

| Model Selection | Guide | | | | | | | | | | | | |

Notes

- 1 Specifications typical at Ta=+25°C, resistive load, nominal input voltage and rated output current unless otherwise noted.
- 2 Transient recovery time is measured to within 1% error band for a step change in output load of 75% to 100%.
- 3 These power converters require a minimum output loading to maintain specified regulation, operation under no-load conditions will not damage these modules; however, they may not meet all specifications listed.
- 4 We recommend to protect the converter by a slow blow fuse in the input supply line.
- 5 Other input and output voltage may be available, please contact MINMAX.
- 6 Specifications are subject to change without notice.

Physical Characteristics

Case Size : 31.8x20.3x10.5mm (1.25x0.8x0.41 inches)

Case Material : Plastic resin (flammability to UL 94V-0 rated)

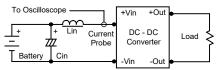

Pin Material : Copper Alloy
Weight : 16.2g

Test Setup

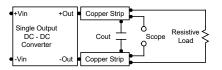

Input Reflected-Ripple Current Test Setup

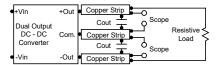

Input reflected-ripple current is measured with a inductor Lin $(4.7\mu\text{H})$ and Cin $(220\mu\text{F}, \text{ESR} < 1.0\Omega \text{ at } 100 \text{ KHz})$ to simulate source impedance. Capacitor Cin, offsets possible battery impedance. Current ripple is measured at the input terminals of the module, measurement bandwidth is 0-500 KHz.

Peak-to-Peak Output Noise Measurement Test

Use a Cout $0.47\mu F$ ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0-20 MHz. Position the load between 50 mm and 75 mm from the DC-DC Converter.

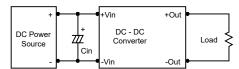

Technical Notes

Overload Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. The unit operates normally once the output current is brought back into its specified range.

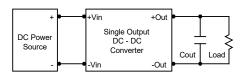

Input Source Impedance

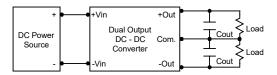

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor on the input to insure startup. Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR < 1.0Ω at $1.00 \, \text{kHz}$) capacitor of a $4.7 \, \mu\text{F}$ for the 24V input devices and $2.2 \, \mu\text{F}$ for the 48V devices.

Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance. To reduce output ripple, it is recommended to use $3.3\mu F$ capacitors at the output.

Maximum Capacitive Load

The MIEI03-HI series has limitation of maximum connected capacitance on the output. The power module may operate in current limiting mode during start-up, affecting the ramp-up and the startup time. Connect capacitors at the point of load for best performance. The maximum capacitance can be found in the data sheet.

Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 100°C. The derating curves are determined from measurements obtained in a test setup.
